

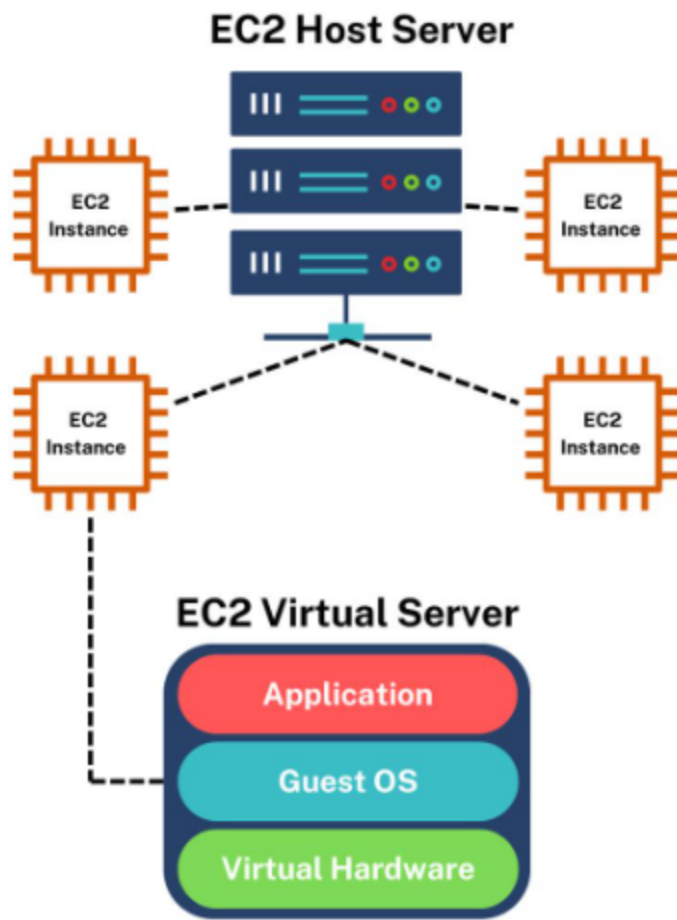

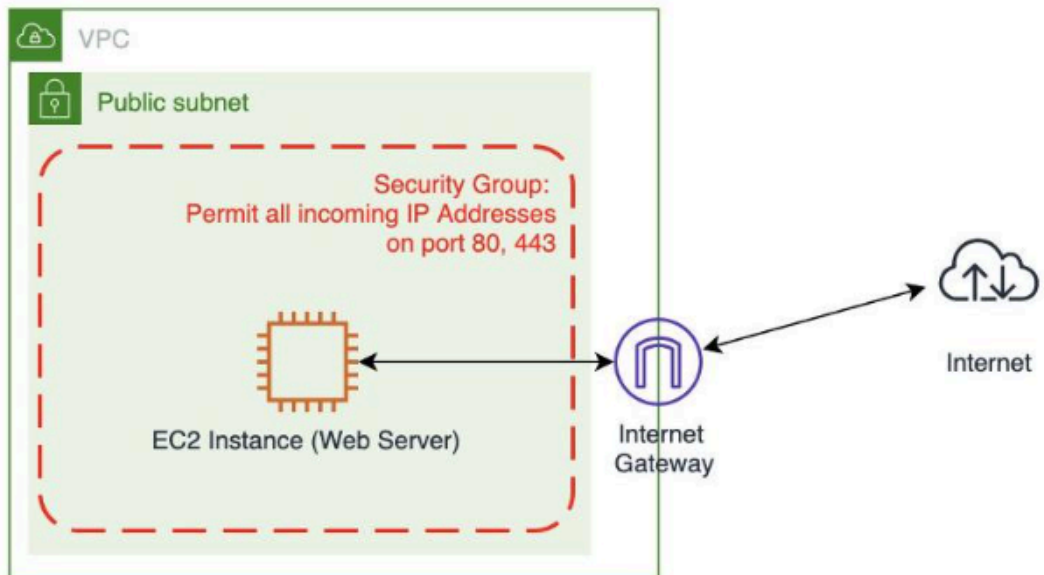

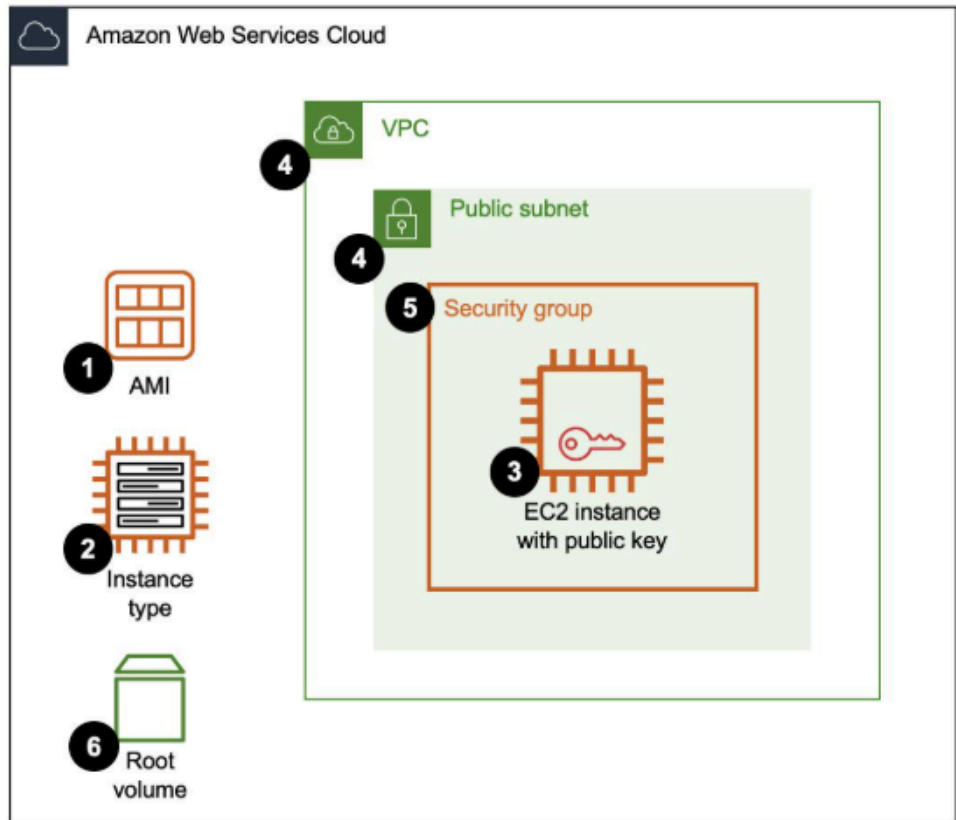

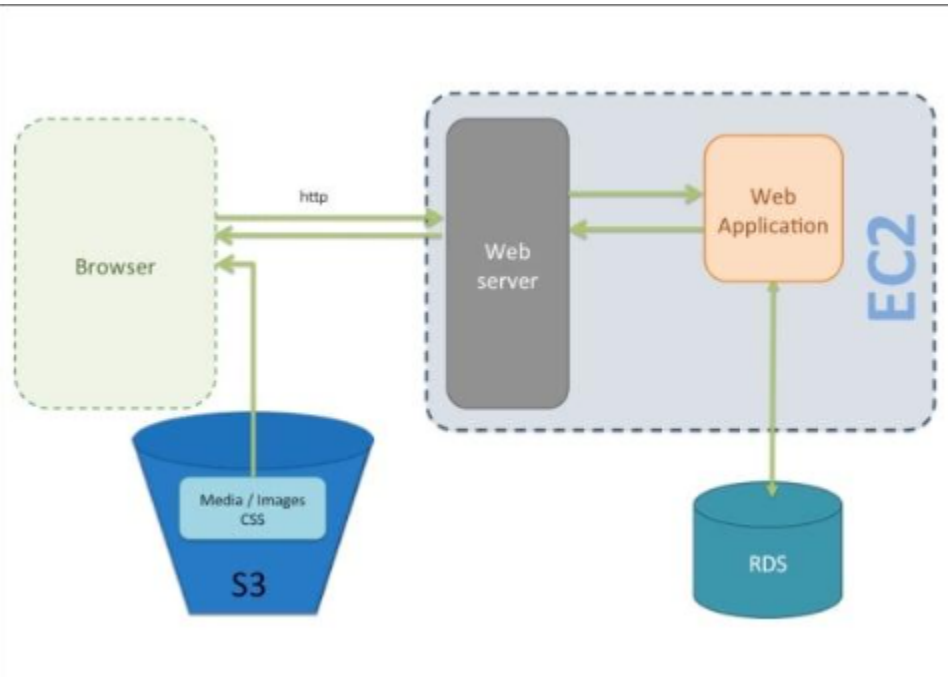

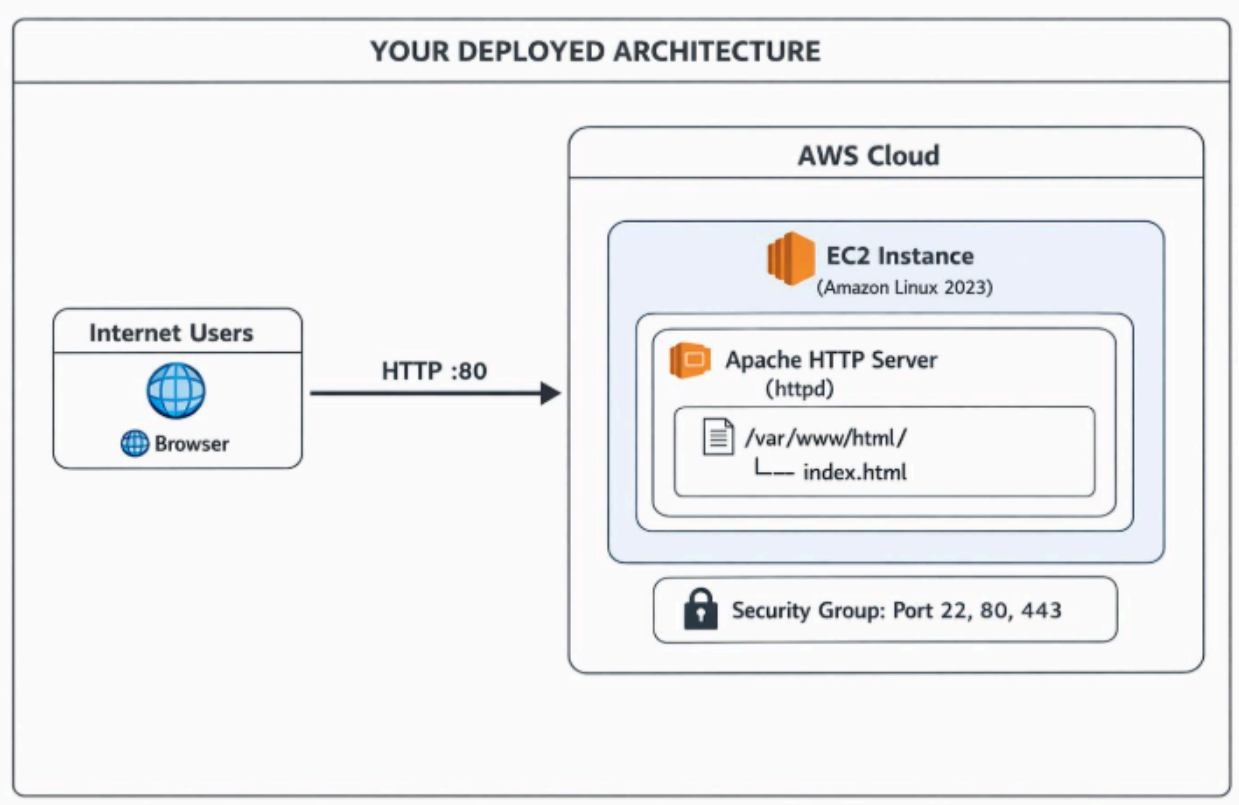

Figure 1. EC2 Host Server

EC2 and Lightsail as two ways to rent a computer/server from AWS.

1. Amazon EC2

EC2 = Elastic Compute Cloud

EC2 gives you a **virtual server in AWS**. You choose the operating system, CPU, RAM, storage, networking, security, and other settings.

What can you use EC2 for?

Use	Example
 Website hosting	Host a website
 Application server	Run Python/Java/Node.js applications
 ML model hosting	Run your own ML inference server
 Database	Run a database yourself
 Backend	API/backend server
 Docker	Run Docker containers
 Enterprise applications	Large customized systems
 Load balancing	Work with Elastic Load Balancer
 Custom software	Install almost anything you need

EC2 example for your ML project

You could do:

Insurance ML Model

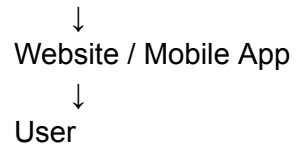

Python / Flask / FastAPI

EC2 Instance

API Endpoint

Here, **you are responsible for managing the server.**
